Commercial Proposal: StyleArchitekt Proof of Concept (PoC)

By 1MAN Agency 2025-10-14

1. Project Objective

The objective of this Proof of Concept (PoC) is to demonstrate the value of the StyleArchitekt platform by:

- Allowing end-users to upload an interior image, receive AI-powered product recommendations, and preview simple visualizations.
- Providing manufacturers with actionable analytics regarding user preferences, product combinations, and purchasing intent.

This approach ensures the PoC delivers measurable insights for manufacturers while minimizing investment by focusing only on the most critical features.

---

2. Scope Adjustments

Removed from the original PoC scope:

- Full marketplace functionality (checkout, payments, returns).
- Supplier portal (order management, SLA dashboards).
- Advanced visualization modules (multi-angle renders, 3D models, Nano Banana integrations).
- Large-scale product database (>1,000 SKUs, >40 brands).
- Persona modifiers (e.g., “families with children,” “pets”).

Added to the scope (aligned with manufacturer priorities – statistics):

- Event tracking (PostHog/Segment) to capture product views, rejections, iterations, and selections.
- B2B analytics dashboard (Metabase/Superset) including:
    - Co-occurrence heatmap (products frequently selected together).
    - Persona and style distribution per brand.
    - Funnel metrics (iterations until final selection).
- Demo reports for manufacturers with early insights into product popularity and user behavior.

---

3. Project Deliverables

User-facing (B2C):

- Image upload and AI classification (style, proportions, lighting).
- Conversational UI for AI recommendations with short explanations.
- Basic visualization (Stable Diffusion XL, single generated render).
- Demo shopping cart (list of selected product IDs, no payment).

Manufacturer-facing (B2B):

- Graph database (Neo4j) with 500 SKUs, 15–20 brands, 6 categories, and 6–8 personas.
- Event tracking capturing key user interactions.
- Analytics dashboard with three core modules:
    - Co-occurrence analysis.
    - Persona/style distribution.
    - Funnel analysis.
- Demo manufacturer report based on initial PoC usage.

4. Definition of Done (Acceptance Criteria, PoC level)

- **Data:** Graph database pre-loaded with **500 dummy SKUs**, 15–20 brands, 6 categories, 6–8 personas.
    - If **real brand data** is required, the client will be responsible for providing it in an agreed format (CSV/API).
- **AI Recommendations:** At least 3 bundle suggestions with explanations (trace); 2–3 alternatives per slot; typical response time target ≤10s P95 (PoC level, non-production SLA).
- **Visualization:** At least one SDXL render + simple 2D overlay with basic scale reference.
- **Analytics:** Three dashboard modules operational (co-occurrence, persona/style, funnel) with a minimum of ~100 test sessions (traffic to be coordinated with client).

4.1 Non-Functional Targets (PoC Scope)

- Target response time: P95 ≤10 seconds for recommendations.
- Demo availability: ~99% uptime during last 2 weeks before final presentation (best effort, PoC level).
- GDPR: data hosted in EU, logs without PII.
- Security: basic OIDC login on/off; simple RBAC (admin vs. viewer).

4.2 Responsibilities

- **Client:** responsible for supplying any real product data (brands/SKUs) in required format and for generating minimal test traffic (≥100 sessions).
- **Agency:** responsible for schema, dummy data ingest, validation reports, analytics setup, and final demo delivery.

Infrastructure & Licensing

- Third-party tools and hosting (Neo4j Aura, PostHog/Segment, Metabase/Superset, storage/CDN, GPU inference) are **not included** in the €20k development budget.

- These services are billed separately as monthly operating costs.

4.3 IP & Handover

- All code and assets created during the PoC remain client's property.
- Private Git repository with client access will be provided.
- Deliverables include deployment instructions, architecture diagram, data model documentation.
- Knowledge transfer: 4–8h training session and a 2-week bugfix grace period after delivery.

4.4 Hybrid Graph + Vector

- A basic vector re-rank layer (e.g. style/palette similarity) will be included to demonstrate hybrid search.
- This remains extendable toward a full vector database in future phases.

---

5. Timeline

- Weeks 1–2: Product schema preparation and database setup (500 SKUs).
- Weeks 3–6: AI prototype (recommendations and basic visualization).
- Weeks 7–9: Event tracking integration and analytics dashboard implementation.
- Weeks 10–12: Testing, quality assurance, and final presentation with manufacturer analytics report.

Total duration: Approximately 12 weeks (2.5 months).

---

5. Budget

5.1 Fixed PoC development budget: €20,000 (excl. VAT).

Payments are done with 50% (€10.000) upfront and 50% (€10.000) after handover.

5.2 Estimated monthly third-party / infrastructure running costs (not included in PoC budget):

- Neo4j Aura (Professional tier, ~20–30 GB) → ~€400/month
- PostHog or Segment (event tracking, 100k–200k events) → ~€200–300/month
- Metabase Cloud (or self-hosted Superset) → ~€100/month
- Object storage (AWS S3 / Backblaze B2, ~200 GB) → ~€50–100/month
- CDN (Cloudflare / AWS CloudFront minimal plan) → ~€50/month
- GPU inference (Stable Diffusion XL via Replicate / HuggingFace / AWS) → ~€500–700/month

Total estimated monthly running cost: €1,300–1,650

---

6. Expected Outcome

By the end of the PoC, the client will have a working prototype demonstrating:

- AI-driven product recommendations and basic visualizations for end-users.
- A functional analytics system that generates insights into product combinations, style alignment, and user behavior.
